Flag
question

Implementation of information security can be accomplished in two ways:
Bottom-up OR Top-down, what is the difference, which is better, and why?

Bottom-Up is the approach where the decision is made from the technical employees and administrators, who work with information systems everyday.

Top-Down is the approach where the decision is made from high-level managers who give direction and issue policies.

Top-Down method is obviously better, because it has stronger management support, assured funding, better communication with other departments of the company, and has clear plans and goals.
